740. Delete and Earn

Solved

MediumTopicsCompaniesHint

You are given an integer array `nums`. You want to maximize the number of points you get by performing the following operation any number of times:

- Pick any `nums[i]` and delete it to earn `nums[i]` points. Afterwards, you must delete **every** element equal to `nums[i] - 1` and **every** element equal to `nums[i] + 1`.

Return the **maximum number of points** you can earn by applying the above operation some number of times.

Example 1:

Input: `nums = [3,4,2]`
Output: 6
Explanation: You can perform the following operations:
- Delete 4 to earn 4 points. Consequently, 3 is also deleted. `nums = [2]`.

8.1K14340 Online

Code

JavaAuto

```
1 class Solution {
2     public int deleteAndEarn(int[] nums) {
3         int max = 0;
4         for(int num : nums){
5             max = Math.max(max, num);
6         }
7         int[] points = new int[max + 1];
8
9         for(int num : nums){
10             points[num] += num;
11         }
12
13         Integer[] dp = new Integer[max + 1];
14         return solve(points, 0, dp);
15     }
16
17     public int solve(int[] points, int idx, Integer[] dp){
18         if(idx == points.length-1) return points[idx];
19
20         if(idx >= points.length) return 0;
21
22         if(dp[idx] != null) return dp[idx];
```

416. Partition Equal Subset Sum

Solved

MediumTopicsCompanies

Given an integer array `nums`, return `true` if you can partition the array into two subsets such that the sum of the elements in both subsets is equal or `false` otherwise.

Example 1:

Input: `nums = [1,5,11,5]`
Output: `true`
Explanation: The array can be partitioned as `[1, 5, 5]` and `[11]`.

Example 2:

Input: `nums = [1,2,3,5]`
Output: `false`
Explanation: The array cannot be partitioned into equal sum subsets.

494. Target Sum

Solved

Medium

Topics

Companies

You are given an integer array `nums` and an integer `target`.

You want to build an **expression** out of `nums` by adding one of the symbols `'+'` and `'-'` before each integer in `nums` and then concatenate all the integers.

- For example, if `nums = [2, 1]`, you can add a `'+'` before `2` and a `'-'` before `1` and concatenate them to build the expression `"+2-1"`.

Return the number of different **expressions** that you can build, which evaluates to `target`.

Example 1:

Input: `nums = [1,1,1,1,1]`, `target = 3`
Output: `5`
Explanation: There are 5 ways to assign symbols to make the sum of `nums` be `target` 3.

Code

JavaAuto

```
1 class Solution {
2     public int findTargetSumWays(int[] nums, int target) {
3         int n = nums.length;
4
5         int total = 0;
6         for(int num : nums){
7             total += num;
8         }
9
10        if((total + target) % 2 != 0 || total < Math.abs(target)) return 0;
11
12        int k = (total + target) / 2;
13
14        int[][] dp = new int[n][k + 1];
15        dp[0][0] = (nums[0] == 0) ? 2 : 1; // without picking any ele also i can make it 0;
16
17        if(nums[0] != 0 && nums[0] <= k){
18            dp[0][nums[0]] = 1;
19        }
20
21        for(int i = 1; i < n; i++){

Problem List

983. Minimum Cost For Tickets

Solved

Medium

Topics

Companies

You have planned some train traveling one year in advance. The days of the year in which you will travel are given as an integer array `days`. Each day is an integer from `1` to `365`.

Train tickets are sold in **three different ways**:

- a **1-day** pass is sold for `costs[0]` dollars,
- a **7-day** pass is sold for `costs[1]` dollars, and
- a **30-day** pass is sold for `costs[2]` dollars.

The passes allow that many days of consecutive travel.

- For example, if we get a **7-day** pass on day `2`, then we can travel for `7` days: `2, 3, 4, 5, 6, 7`, and `8`.

Return the *minimum number of dollars you need to travel every day in the given list of days*.

1049. Last Stone Weight II

Solved

Medium

Topics

Companies

Hint

You are given an array of integers `stones` where `stones[i]` is the weight of the `ith` stone.

We are playing a game with the stones. On each turn, we choose any two stones and smash them together. Suppose the stones have weights `x` and `y` with `x <= y`. The result of this smash is:

- If `x = y`, both stones are destroyed, and
- If `x != y`, the stone of weight `x` is destroyed, and the stone of weight `y` has new weight `y - x`.

At the end of the game, there is **at most one** stone left.

Return the *smallest possible weight of the left stone*. If there are no stones left, return `0`.

Example 1:

Input: `stones = [2,7,4,1,8,1]`

Code

JavaAuto

```
1 class Solution {
2     public int lastStoneWeightII(int[] stones) {
3         int sum = 0;
4
5         for (int stone : stones) {
6             sum += stone;
7         }
8
9         int target = sum / 2;
10        boolean[] dp = new boolean[target + 1];
11        dp[0] = true;
12
13        for (int stone : stones) {
14            for (int j = target; j >= stone; j--) {
15                dp[j] = dp[j] || dp[j - stone];
16            }
17        }
18
19        for (int i = target; i >= 0; i--) {
20            if (dp[i]) {
21                return sum - 2 * i;
22            }
23        }
